Learning-based spin estimation of table tennis ball with an event camera

Progress report week 15

Levin Kolmar

Summary

- Sim vs real event statistics (see discord)
- Changed from spot light to area light and moved to the ceiling.

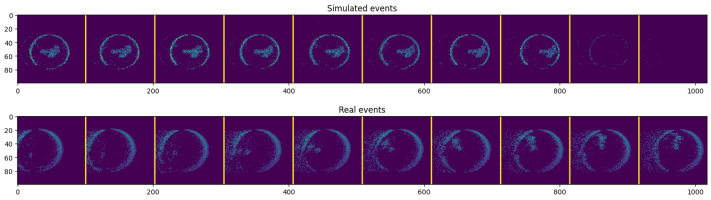

Figure 1: Light top

- tuned some simulation parameters. Sim / real = 0.87 (event ratio)

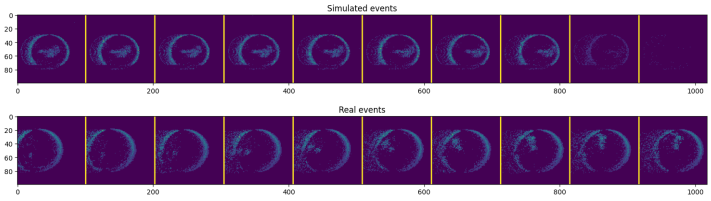

Figure 2: Parameters tuned

Open questions

- Do you think this setup is good enough?
- What could we adjust to get more realistic simulations
- What Which should we include into the next dataset?

Next steps

- improve simualtion
- simulate dataset
- train new model
